- **Data types**
- **Variables**
- **Backslash character**
- **Operators**

Parts of C++ program

```
// A simple C++ program
#include <iostream>
using namespace std;

int main()
{
    cout << "Programming is great fun!";
    return 0;
}
```

The `iostream` file contains code that allows a C++ program to display output on the screen and read input from the keyboard.

The statement `using namespace std;` declares that the program will be accessing entities whose names are part of the namespace called `std`.

The reason the program needs access to the `std` namespace is because every name created by the `iostream` file is part of that namespace.

Parts of C++ program

This marks the beginning of a function. A function can be thought of as a group of one or more programming statements that collectively has a name.

Int stands for integer, it indicates that the function sends an integer value back to the operating system when it is finished executing.

Although most C++ programs have more than one function, every C++ program must have a function called main.

NOTE: C++ is a case-sensitive language. That means it regards uppercase letters as being entirely different characters than their lowercase counterparts. In C++, the name of the function `main` must be written in all lowercase letters.

Language Elements

Language Element	Description
Key Words	Words that have a special meaning. Key words may only be used for their intended purpose. Key words are also known as reserved words.
Programmer-Defined Identifiers	Words or names defined by the programmer. They are symbolic names that refer to variables or programming routines.
Operators	Operators perform operations on one or more operands. An operand is usually a piece of data, like a number.
Punctuation	Punctuation characters that mark the beginning or ending of a statement, or separate items in a list.
Syntax	Rules that must be followed when constructing a program. Syntax dictates how key words and operators may be used, and where punctuation symbols must appear.

Some of keywords

<code>alignas</code>	<code>const</code>	<code>for</code>	<code>private</code>	<code>throw</code>
<code>alignof</code>	<code>constexpr</code>	<code>friend</code>	<code>protected</code>	<code>true</code>
<code>and</code>	<code>const_cast</code>	<code>goto</code>	<code>public</code>	<code>try</code>
<code>and_eq</code>	<code>continue</code>	<code>if</code>	<code>register</code>	<code>typedef</code>
<code>asm</code>	<code>decltype</code>	<code>inline</code>	<code>reinterpret_cast</code>	<code>typeid</code>
<code>auto</code>	<code>default</code>	<code>int</code>	<code>return</code>	<code>typename</code>
<code>bitand</code>	<code>delete</code>	<code>long</code>	<code>short</code>	<code>union</code>
<code>bitor</code>	<code>do</code>	<code>mutable</code>	<code>signed</code>	<code>unsigned</code>
<code>bool</code>	<code>double</code>	<code>namespace</code>	<code>sizeof</code>	<code>using</code>
<code>break</code>	<code>dynamic_cast</code>	<code>new</code>	<code>static</code>	<code>virtual</code>
<code>case</code>	<code>else</code>	<code>noexcept</code>	<code>static_assert</code>	<code>void</code>
<code>catch</code>	<code>enum</code>	<code>not</code>	<code>static_cast</code>	<code>volatile</code>
<code>char</code>	<code>explicit</code>	<code>not_eq</code>	<code>struct</code>	<code>wchar_t</code>
<code>char16_t</code>	<code>export</code>	<code>nullptr</code>	<code>switch</code>	<code>while</code>
<code>char32_t</code>	<code>extern</code>	<code>operator</code>	<code>template</code>	<code>xor</code>
<code>class</code>	<code>false</code>	<code>or</code>	<code>this</code>	<code>xor_eq</code>
<code>compl</code>	<code>float</code>	<code>or_eq</code>	<code>thread_local</code>	

Data Types

There are many different types of data. Variables are classified according to their data type, which determines the kind of information that may be stored in them.

Data Type	Typical Size	Typical Range
<code>short int</code>	2 bytes	−32,768 to +32,767
<code>unsigned short int</code>	2 bytes	0 to +65,535
<code>int</code>	4 bytes	−2,147,483,648 to +2,147,483,647
<code>unsigned int</code>	4 bytes	0 to 4,294,967,295
<code>long int</code>	4 bytes	−2,147,483,648 to +2,147,483,647
<code>unsigned long int</code>	4 bytes	0 to 4,294,967,295
<code>long long int</code>	8 bytes	−9,223,372,036,854,775,808 to 9,223,372,036,854,775,807
<code>unsigned long long int</code>	8 bytes	0 to 18,446,744,073,709,551,615

Identifiers

The names of variables, functions, labels, and various other user-defined objects are called identifiers. These identifiers can vary from one to several characters.

- The first character must be one of the letters a through z, A through Z, or an underscore character (_).
- After the first character you may use the letters a through z or A through Z, the digits 0 through 9, or underscores.
- Uppercase and lowercase characters are distinct. This means `ItemsOrdered` is not the same as `itemsordered`.

Variables

Variable Name	Legal or Illegal?
dayOfWeek	Legal.
3dGraph	Illegal. Variable names cannot begin with a digit.
_employee_num	Legal.
June1997	Legal.
Mixture#3	Illegal. Variable names may only use letters, digits, or underscores.

Variable Initializations

Some examples are

```
char ch = 'a';
```

```
int first = 0;
```

```
float balance = 123.23;
```

Local Variables

Variables that are declared inside a function are called local variables.

```
#include <iostream>
using namespace std;
int main()
{
    int x=44;
    cout << x << endl;
    return 0;
}
```

Global Variables

Global variables are known throughout the program and may be used by any piece of code.

These variables are declared before all program's functions.

```
#include <iostream>
using namespace std;
int x=44;
int main()
{
    cout << x << endl;
    return 0;
}
```

Const Variables

Variables of type const may not be changed by your program.

The compiler is free to place variables of this type into read-only memory (ROM).

```
#include <iostream>
using namespace std;
const int x=44;
int main()
{
    cout << x << endl;
    return 0;
}
```

Backslash Character Constants

```
#include <iostream>
using namespace std;
const int x=44;
int main()
{
    cout << "The value of x \n"<<x;
    return 0;
}
```

The value of x
44

Backslash Character Constants

Code	Meaning
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
\"	Double quote
\'	Single quote
\0	Null
\\	Backslash
\v	Vertical tab
\a	Alert
\?	Question mark
\N	Octal constant (where N is an octal constant)
\xN	Hexadecimal constant (where N is a hexadecimal constant)

Operators

- There are four main classes of operators: arithmetic, relational, logical, and bitwise.
- Generally, there are three types of operators: unary, binary, and ternary. These terms reflect the number of operands an operator requires.
- Unary operators only require a single operand.
-, ++, --
for example: -5
++, it is increment operator
--, it is decrement operator

Arithmetic Operators

- Binary operators work with two operands.

Operator	Meaning	Type	Example
+	Addition	Binary	<code>total = cost + tax;</code>
-	Subtraction	Binary	<code>cost = total - tax;</code>
*	Multiplication	Binary	<code>tax = cost * rate;</code>
/	Division	Binary	<code>salePrice = original / 2;</code>
%	Modulus	Binary	<code>remainder = value % 3;</code>

Arithmetic Operators

- Binary operators work with two operands.

`x++;`

is the same as

`x = x + 1;`

`x--;`

is the same as

`x = x - 1;`

Arithmetic Operators

The precedence of the arithmetic operators

highest

++ --

– (unary minus)

* / %

lowest

+ –

Expression	Value
5 + 2 * 4	13
10 / 2 - 3	2
8 + 12 * 2 - 4	28
4 + 17 % 2 - 1	4
6 - 3 * 2 + 7 - 1	6

Relational and Logical Operators

Relational refers to the operator that tests or defines some kind of relation between two entities.

Logical refers to the ways these relationships can be connected.

p	q	p && q	p q	!p
0	0	0	0	1
0	1	0	1	1
1	1	1	1	0
1	0	0	1	0

Relational and Logical Operators

Relational Operators

Operator	Action
>	Greater than
>=	Greater than or equal
<	Less than
<=	Less than or equal
=	Equal
!=	Not equal

Logical Operators

Operator	Action
&&	AND
	OR
!	NOT

Table 2-5. *Relational and Logical Operators*

Relational and Logical Operators

Highest

Combined Assignment Operators

The combined assignment operators, also known as compound operators, and arithmetic assignment operators.

Operator	Example Usage	Equivalent to
<code>+=</code>	<code>x += 5;</code>	<code>x = x + 5;</code>
<code>-=</code>	<code>y -= 2;</code>	<code>y = y - 2;</code>
<code>*=</code>	<code>z *= 10;</code>	<code>z = z * 10;</code>
<code>/=</code>	<code>a /= b;</code>	<code>a = a / b;</code>
<code>%=</code>	<code>c %= 3;</code>	<code>c = c % 3;</code>

Combined Assignment Operators

Example Usage

`x += b + 5;`

`y -= a * 2;`

`z *= 10 - c;`

`a /= b + c;`

`c %= d - 3;`

Equivalent to

`x = x + (b + 5);`

`y = y - (a * 2);`

`z = z * (10 - c);`

`a = a / (b + c);`

`c = c % (d - 3);`

The End
